

ABSTRACT

A color referenced multi-time keeping timepiece includes at least two clocks on the same watch. These at least two clocks may be positioned one above the other, at a diagonal angle relative to each other, or side by side. The lens of one or both clocks is tinted and the minute and hour hands of each clock are brightly colored. The colored hands are fluorescent, making them easy to see, and also causing them to contrast with the color of the tinted lens. The face of each clock is phosphorescent, making the clock easy and convenient to read in low-light conditions. The tinting of one or both lenses provides a mental reference point for different time zones while the contrasting colors of the watch hands relative to the tinted lenses make it easy to see the necessarily smaller watch hands.
